

The Midpoint Theorem : The line segment connecting the midpoints of two sides of a triangle is parallel to the other side, and its length is half the length of the other side.

삼각형 중점연결정리 : 삼각형의 두 변의 중점을 연결한 선분은 나머지 변과 평행하고 길이는 나머지 변의 길이의 반이다.

(The Midpoint Theorem : The line segment connecting the midpoints of two sides of a triangle is parallel to the other side, and its length is half the length of the other side.)

The Midpoint Theorem : The line segment connecting the midpoints of two sides of a triangle is parallel to the other side, and its length is half the length of the other side.

The Midpoint Theorem : The line segment connecting the midpoints of two sides of a triangle is parallel to the other side, and its length is half the length of the other side.
