# 원에서 한 호에 대한 원주각은 중심각의 크기의 반이다.(중심이 원주각의 내부에 있을 때)

(In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference))

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
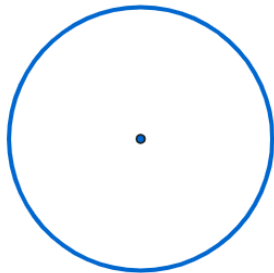

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
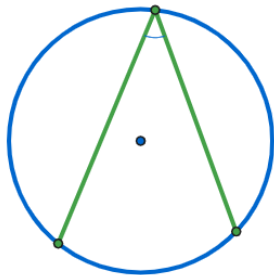

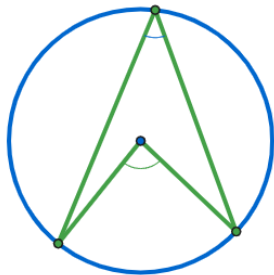

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

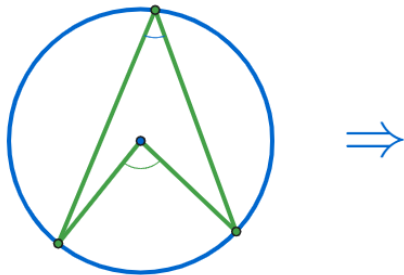

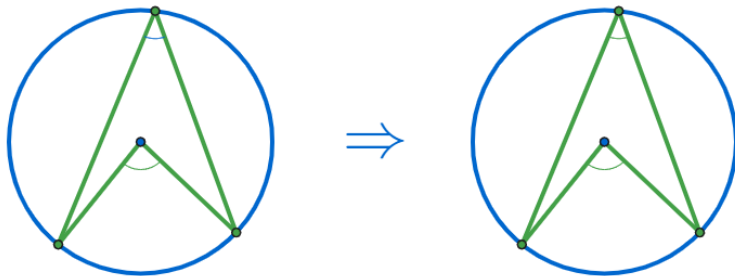

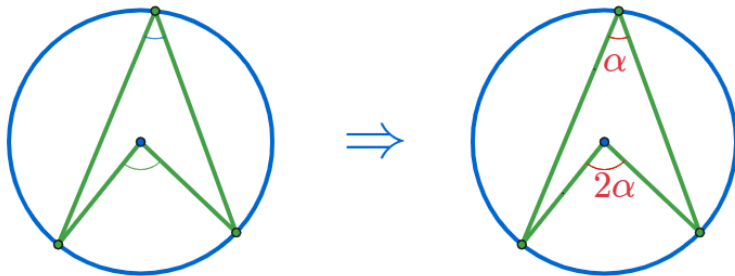

$\Longrightarrow$

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
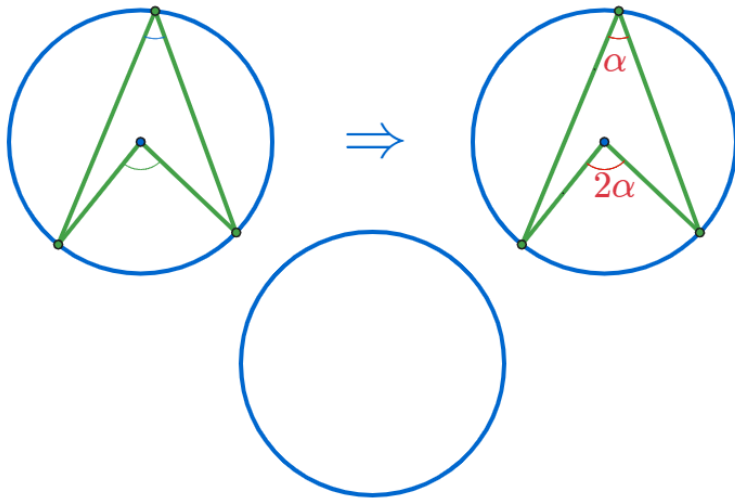

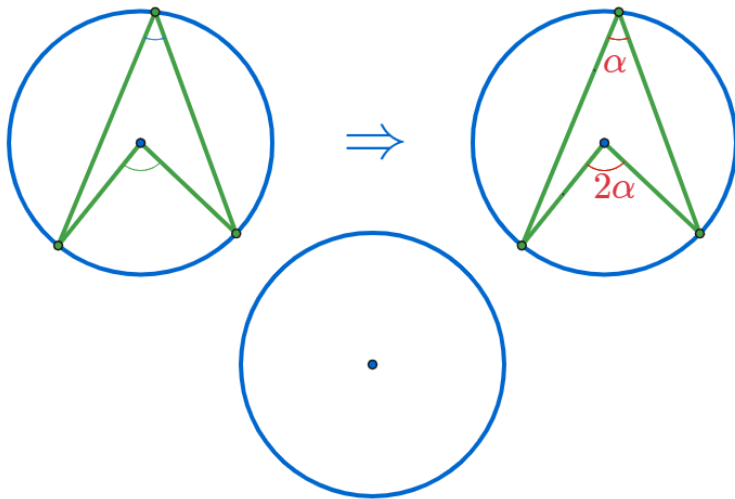

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
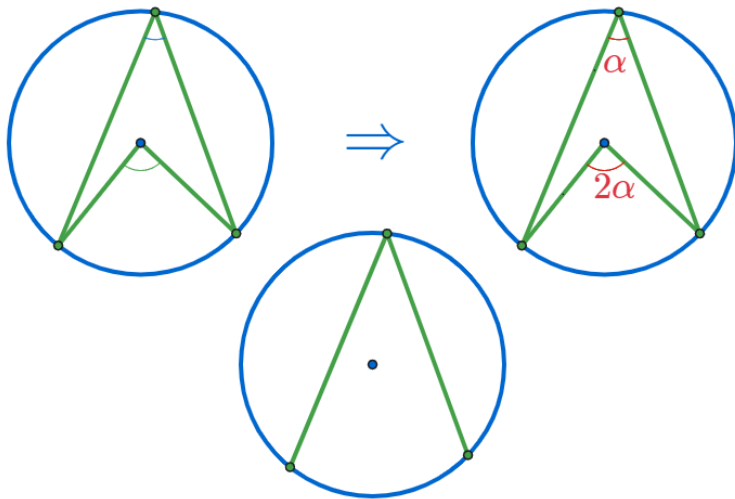

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
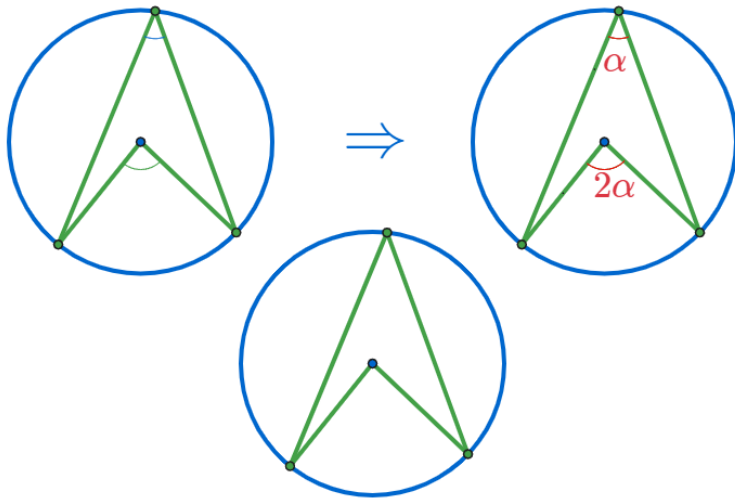

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
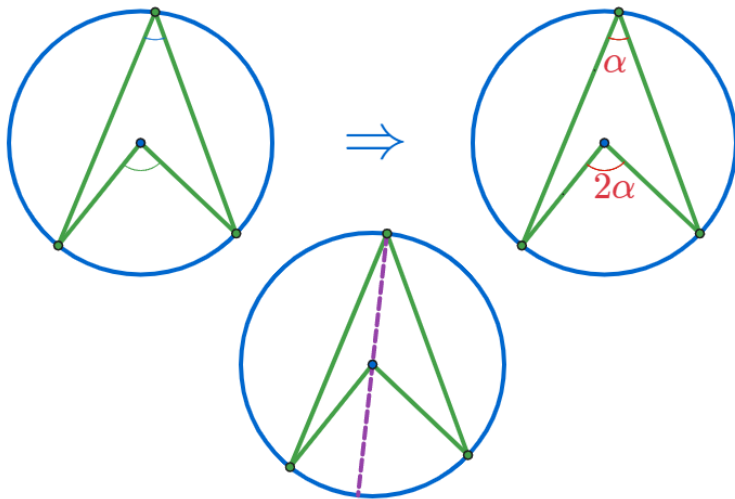

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)
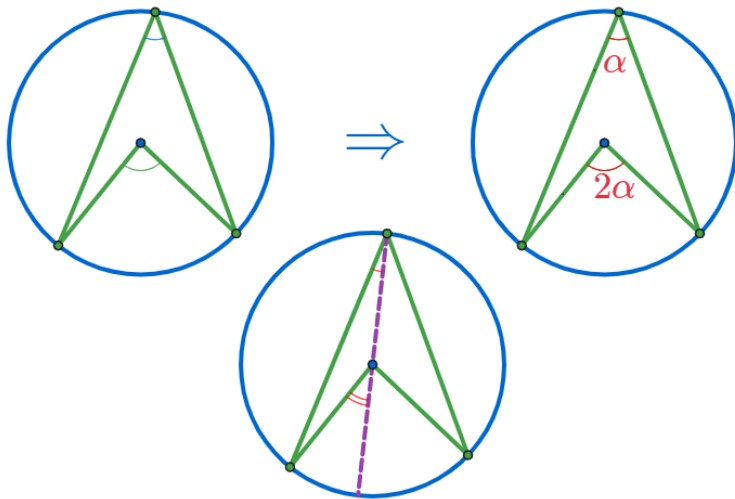

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

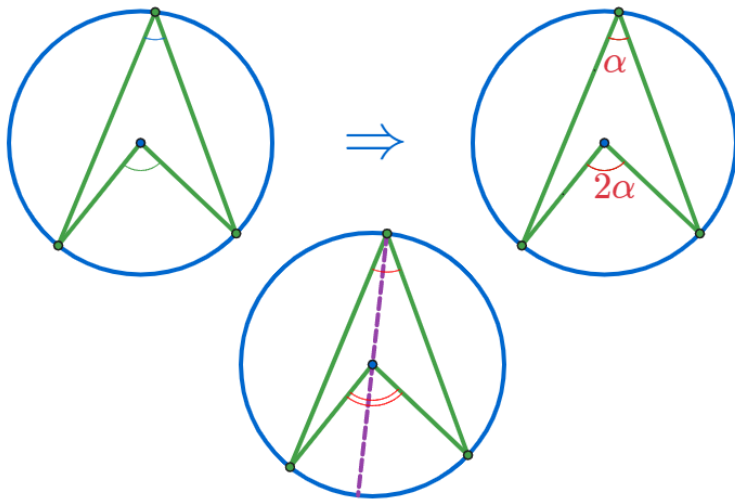

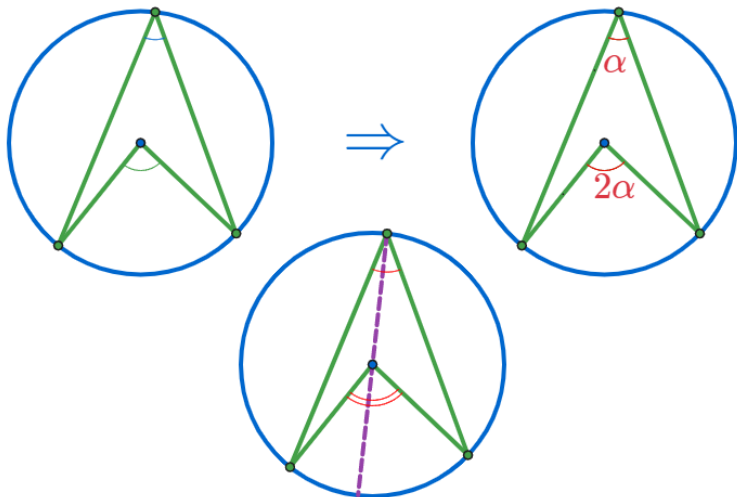

∵원주각은 중심각의 크기의 반이다.(중심이 원주각의 한 변위에 있을 때)
(In any circle, a circumferential angle is half the size of the central angle subtending the same arc.
(when the center is at a displacement of the circumferential angle))

In any circle, a circumferential angle is half the size of the central angle subtending the same arc. (When the center is inside the circumference)

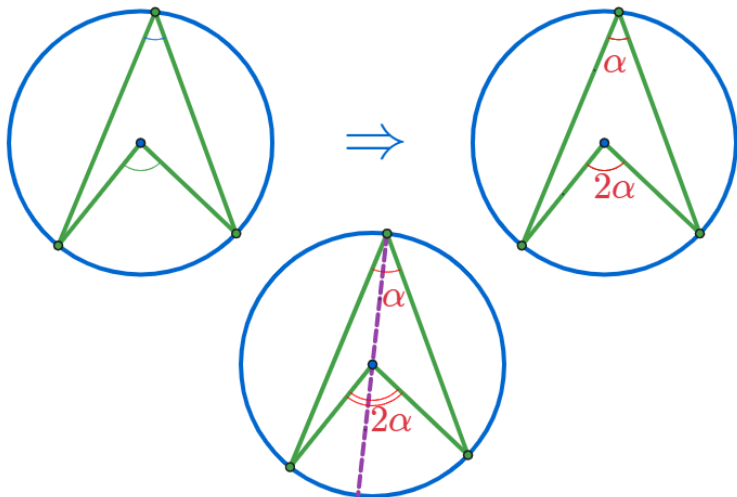

∵원주각은 중심각의 크기의 반이다.(중심이 원주각의 한 변위에 있을 때)
(In any circle, a circumferential angle is half the size of the central angle subtending the same arc.
(when the center is at a displacement of the circumferential angle))
