## With a given length, and with two points and one straight line, construct a

 point where the sum of the distances between one point on these straight line and the two points is the given length.주어진 길이가 있고 두 점과 한 직선이 주어진 상태에서 이 직선상의 점과 두 점과의 거리의 합이 주어진 길이가 되는 점을 작도하여라.
(With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.)

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.

With a given length, and with two points and one straight line, construct a point where the sum of the distances between one point on these straight line and the two points is the given length.
